

About Moody's

Brief description of Moody's Analytics Climate Pathway Scenario Service and ESG Solutions.

Moody's Corporation (Moody's), an American business and financial services company, is best known for its credit rating agency. Growing with the times, Moody's Analytics (a subsidiary of Moody's Corporation established in 2007 to focus on non-rating activities) last year won an award for 'Climate Risk Initiative of the Year' at the Insurance Asset Risk Awards in recognition of its support to insurers in effectively measuring and managing their exposure to climate risk.

Driven by award-winning scenario generation software used to quantify the financial impact from physical and transition risk, Moody's Analytics Climate Pathway Scenario Service helps insurers to meet the demands of the Task Force on Climate-Related Financial Disclosures through modelling projections of assets and liabilities. In addition, the scenarios generated by the software enable climate risk to be better integrated into asset allocation and investment. Without doubt, Moody's stands at the forefront of helping the insurance sector respond to climate risk, harnessing a multidisciplinary team of quantitative analysts, economists, and financial engineers.

As well as this, Moody's ESG Solutions helps organisations improve decision making in the face of a changing climate, using risk scores to assess risks and opportunities. At present, the capability covers exposure to climate hazards for: 10,000 listed companies with 3m corporate facilities globally, amongst other organisations, and enables business to quantify transition risk exposure from different fossil fuel resource types and power generation technologies. In this way, Moody's is at the forefront of bringing physical and transition risk into investment analysis and insurance; helping clients prepare for, and understand the risks of, climate change.
